

Founder Adoption Record

EquineSync Product Implementation Atlas Framework

Decision Date: July 19, 2026

Decision Authority: Rian Ray, Founder

Disposition:

FOUNDER_ADOPTED_PIA_DEFINITION_PURPOSE_AND_MANDATORY_CONTENT_REQUIREMENTS

The Founder formally adopts the following definition of a Product Implementation Atlas:

A Product Implementation Atlas is the authoritative, version-controlled, domain-specific implementation instrument that translates EquineSync constitutional governance, MAIP requirements, founder decisions, product workflows, operational rules, data responsibilities, technical contracts, verification requirements, and release conditions into a complete and traceable basis for software construction and assurance.

The Founder accepts the aligned purpose of the Product Implementation Atlases as the controlled bridge between EquineSync's constitutional governance, the MAIP, engineering implementation, testing, evidence generation, release review, and first-user enrollment.

Each Product Implementation Atlas must:

1. Include all required PIA sections established by the adopted framework.
2. Maintain traceability to controlling governance, applicable founder decisions, and the MAIP.
3. Define product, operational, data, technical, security, verification, evidence, and release requirements with sufficient specificity for implementation.
4. Distinguish controlling requirements, implementation decisions, assumptions, unresolved matters, retained risks, deferred work, and out-of-scope functionality.
5. Answer the following five mandatory readiness questions:
 6. Can engineering build the capability without making unauthorized product decisions?
 7. Can quality assurance determine objectively whether the capability works?
 8. Can a reviewer trace the capability to EquineSync's controlling governance and the MAIP?
 9. Can EquineSync safely operate, support, monitor, recover, and maintain the capability?
 10. Can the Founder determine whether the capability is ready for first-user enrollment?

A PIA may not be classified as implementation-ready when any mandatory section is materially incomplete or when any of the five readiness questions cannot be answered affirmatively with supporting evidence.

The adopted implementation chain is:

**Constitutional Governance → MAIP → Product Implementation Atlas → Engineering Work Packages
→ Code → Tests → Evidence → Release Decision**

This decision governs the drafting, review, approval, versioning, implementation use, and assurance evaluation of all EquineSync Product Implementation Atlases.
