

FOUNDER ADOPTION AND APPROVAL RECORD

EQUINESYNC PRODUCT IMPLEMENTATION ATLAS MASTER STANDARD AND CONTROLLED TEMPLATE

Decision Authority: Rian Ray, Founder

Decision Date: July 19, 2026

Approved Document: ES-PIA-MASTER-STANDARD-V1.1

Approved Title: EquineSync Product Implementation Atlas Master Standard and Controlled Template

Disposition: FOUNDER_APPROVED_ADOPTED_AND_EFFECTIVE

External Assurance Status: NOT_EXTERNALLY_ASSURED

The Founder formally approves and adopts the **EquineSync Product Implementation Atlas Master Standard and Controlled Template Version 1.1** as the controlling internal standard for the creation, review, approval, implementation, verification, operation, maintenance, supersession, and decommissioning of all EquineSync Product Implementation Atlases.

This approval confirms that Version 1.1:

1. Supersedes the prior Version 1.0 candidate.
2. Governs all foundational, domain, cross-domain, platform, integration, experience, migration, and assurance PIAs.
3. Controls the relationship between:
 4. EquineSync constitutional governance;
 5. Founder decisions;
 6. the MAIP;
 7. Product Implementation Atlases;
 8. engineering work packages;
 9. source code and configuration;
 10. testing and evidence;
 11. operational readiness; and
 12. controlled user enrollment.
13. Establishes the required distinction between:
 14. the **as-designed baseline**;
 15. the **as-built baseline**; and
 16. the **as-verified baseline**.
17. Requires controlled review of implementation drift before verification or release.
18. Establishes the BRAVO quality standard:

19. Buildable;
20. Reviewable;
21. Auditable;
22. Verifiable; and
23. Operable.
24. Requires every EquineSync PIA to include the complete mandatory section set or a formally justified and reviewed non-applicability determination.
25. Requires every EquineSync PIA to answer the five mandatory readiness questions concerning:
26. engineering buildability without unauthorized product decisions;
27. objective quality-assurance verification;
28. traceability to constitutional governance and the MAIP;
29. safe operation, support, monitoring, recovery, and maintenance; and
30. readiness for controlled first-user enrollment.
31. Establishes separate gates for:
32. design completion;
33. Founder design approval;
34. implementation authorization;
35. implementation conformity;
36. verification;
37. operational readiness; and
38. first-user enrollment.
39. Requires preserved evidence, traceability, findings classification, dependency control, rollout planning, rollback capability, support readiness, and Founder disposition before applicable release claims may be made.

No EquineSync PIA may be represented as:

- design-complete;
- implementation-ready;
- implementation-authorized;
- implemented;
- conformant;
- verified;
- operationally ready;
- release-ready; or
- ready for controlled first-user enrollment

unless it satisfies the applicable requirements and gates of the approved Master Standard or is covered by a valid Founder-authorized deviation.

The approved controlling implementation chain is:

**Constitutional Governance → Founder Decisions → MAIP → Product Implementation
Atlas → Engineering Work Packages → Code and Configuration → Tests → Evidence →
Release Decision → Controlled Enrollment**

The approved controlling operating principle is:

**Governance establishes authority.
The MAIP establishes coordinated implementation direction.
The PIA establishes domain-level executable truth.
Engineering creates the as-built implementation.
Reconciliation detects drift.
Testing challenges the implementation.
Evidence proves the verified result.
Operations make the capability supportable and recoverable.
The Founder determines whether enrollment may begin.**

Effective Status: The EquineSync Product Implementation Atlas Master Standard and Controlled Template Version 1.1 is adopted and effective as the controlling PIA standard as of July 19, 2026.
